SLA breaches have doubled - service is no longer meeting targets

SLA Breach Rate

Up from ~40% to ~88% in two years

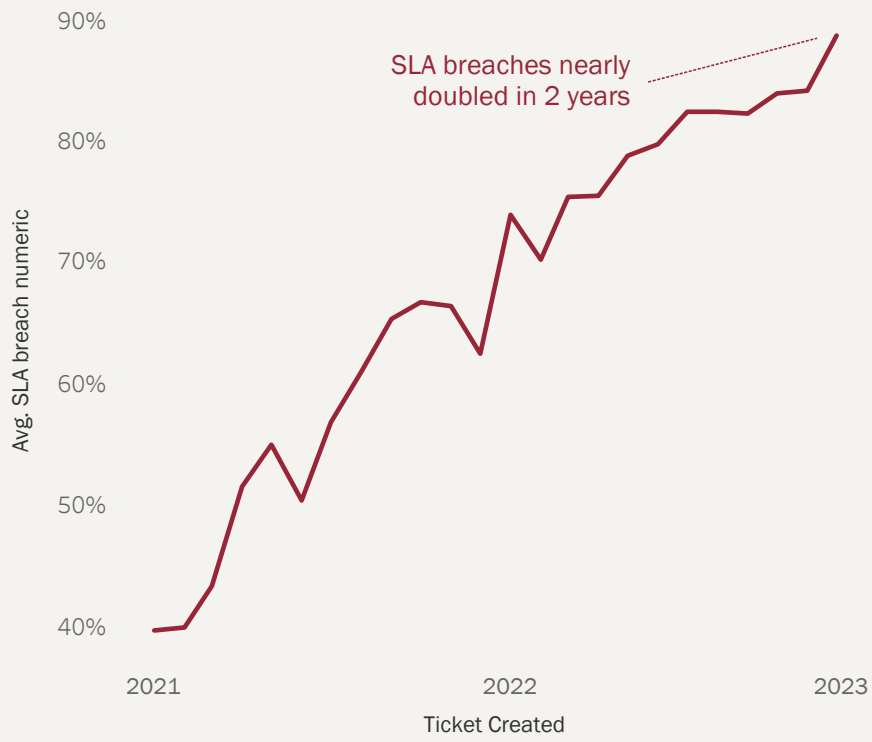
Target is ~25%

70.4%

Resolution time trend (hrs) & Csat score

Longer resolution times reduce customer satisfaction

SLA breach trend rate

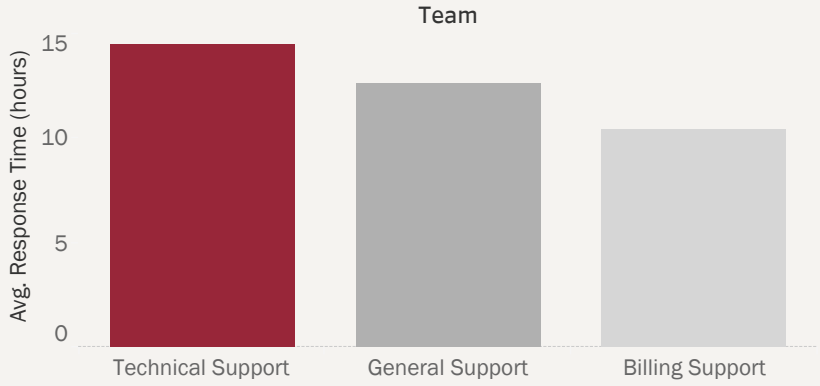


Failure zone (>80%) reached

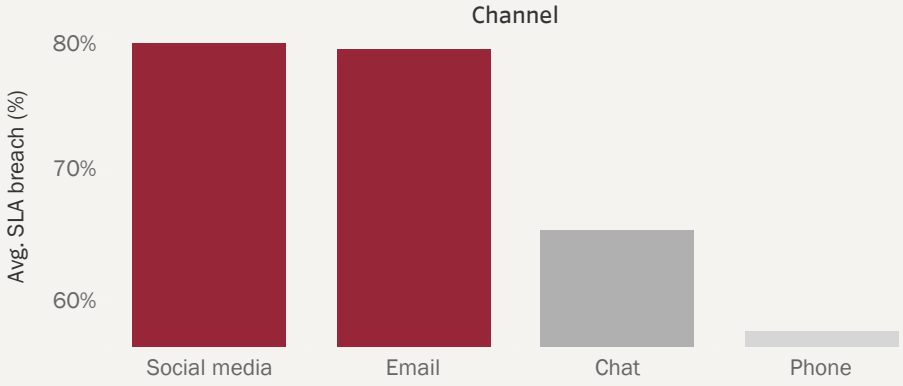
As resolution times increase, customer satisfaction declines — indicating a direct impact on service quality.

SLA Breaches are driven by technical support bottleneck

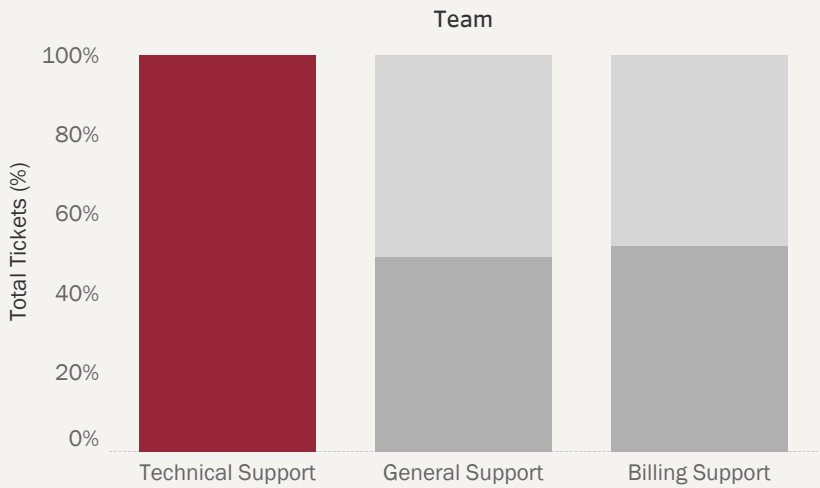
Response Time by Team



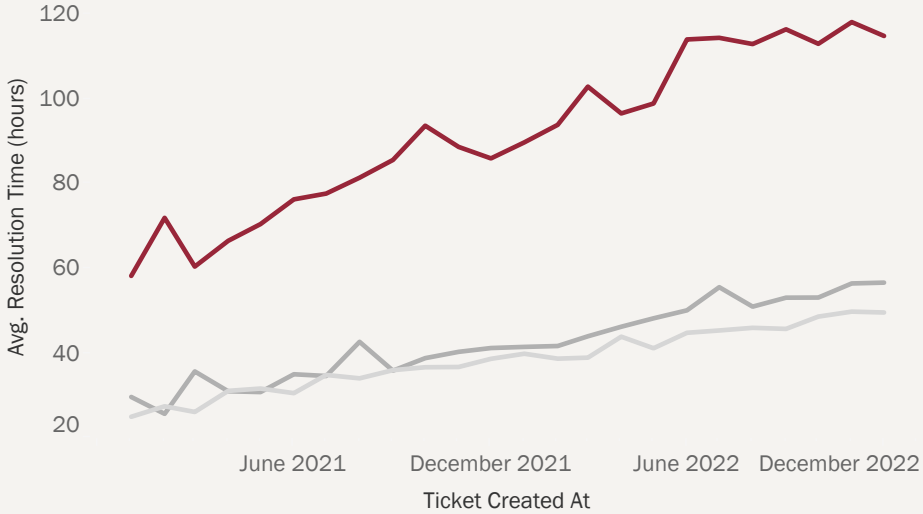
SLA breach by channel



Technical Work Is Concentrated in Technical Support

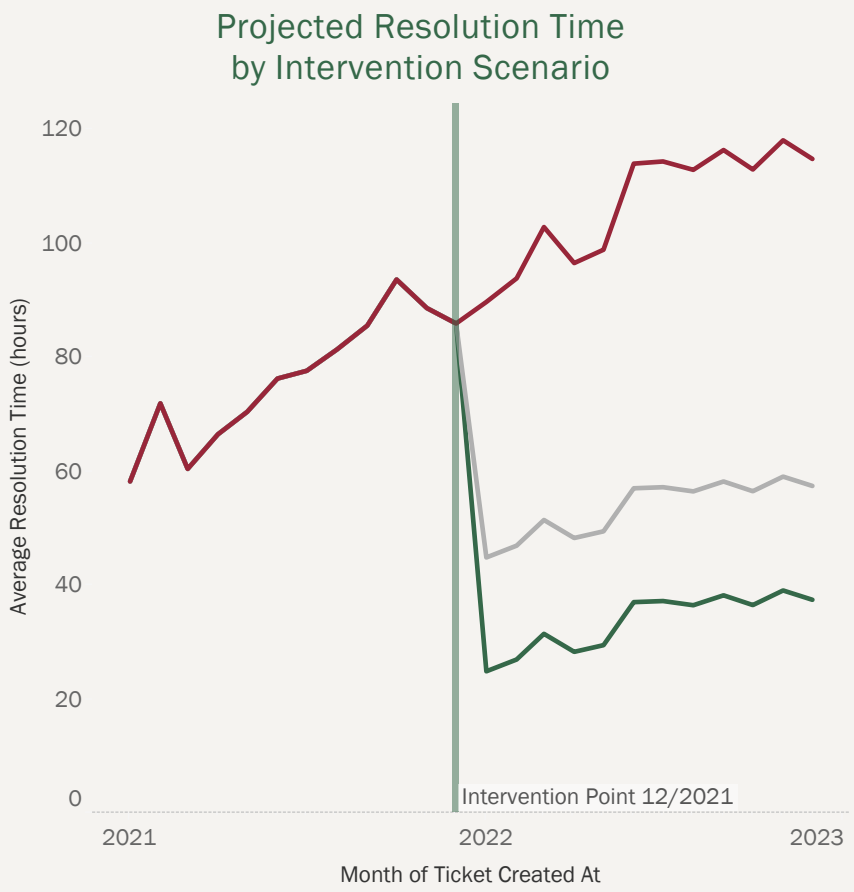


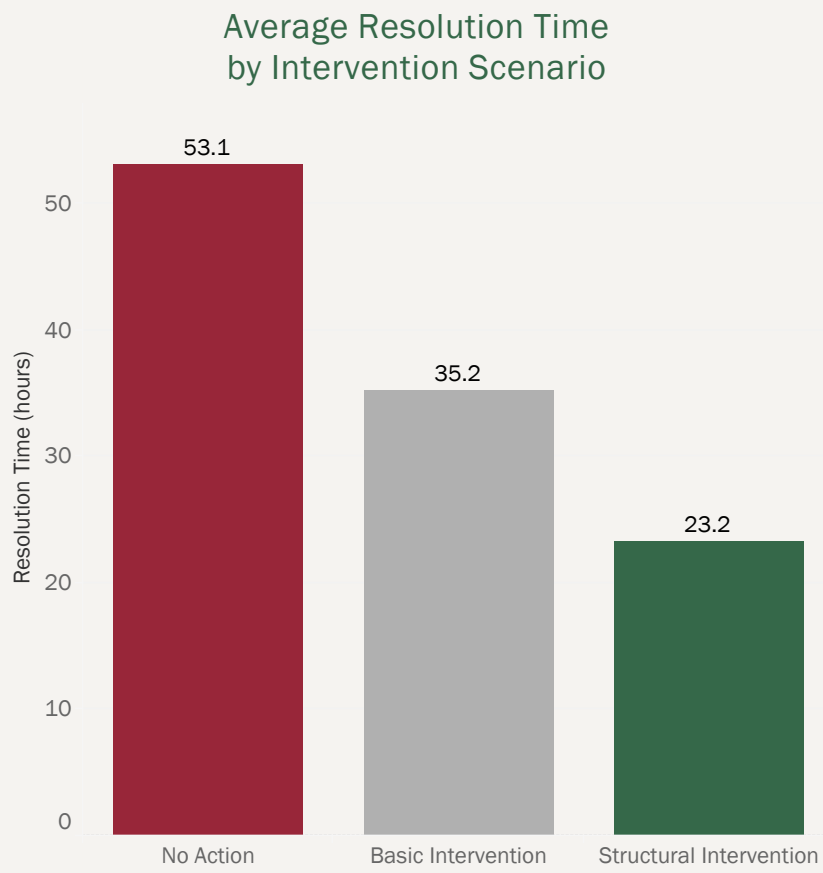
Resolution Time Trend by Team



Technical Support handles all technical issues, which also have the highest resolution time and shows the steepest increase in resolution time, confirming a structural bottleneck rather than a performance issue.

Stabilizing Service Performance Through Operational Intervention





Conclusions:
- Resolution time trends indicate that the current support model is not sustainable.
- Redistributing simpler tickets across teams reduces workload but does not fully address the underlying capacity constraint.
- A structural intervention—such as increasing Technical Support capacity—produces the largest and most stable reduction in resolution time and represents the most effective path to restoring service performance.
- Only structural intervention moves performance meaningfully toward acceptable SLA levels
